Article - Animal welfare and protection: EU laws explained (videos)

Wildlife protection

The 500 **wild birds** naturally occurring in the EU are protected by the <u>Birds</u> <u>Directive</u>, whilst the <u>Habitats Directive</u> aims to ensure the conservation of <u>rare</u>, threatened or endemic animal <u>species</u> and characteristic habitat types.

The EU Pollinators Initiative was launched in 2018 to tackle the <u>decline of wild pollinating insects</u>, especially bees. Parliament called for a <u>further reduction of pesticides and more funds for research</u>. In a report adopted in January 2018, Parliament had already said <u>regional and local bees varieties should be better protected</u>.

<u>Whales and dolphins are protected</u> from capture and killing in EU waters. In addition, the EU has always been a defender of the full implementation of the <u>moratorium on commercial whaling</u> in place since 1986.

An EU regulation bans the trade in seal products.

There are also rules on <u>trapping methods</u>, prohibiting the use of leghold traps to catch wild animals in the EU and setting humane standards.

The EU implements and goes beyond the provisions of the Convention on

<u>International Trade in Endangered Species of Wild Fauna and Flora</u> (Cites) through its <u>Wildlife Trade Regulations</u> to ensure trade in **wildlife products** does not lead to species becoming endangered.

In May 2020, the Commission presented an <u>ambitious new Biodiversity Strategy</u> as part of the <u>EU Green Deal</u>.

Zoos

<u>EU rules on keeping wild animals in zoos</u> seek to strengthen their role in the conservation of biodiversity and set standards for protection measures, including appropriate accommodation for animals.

Animal testing for scientific purposes

The EU has created a legal framework that <u>regulates</u> animal studies for the development of new medicines, for physiological studies and for testing of food additives or chemicals. The rules are based on the principle of the three R's:

- Replacement (fostering the use of alternative methods)
- Reduction (trying to use fewer animals for the same objective)
- Refinement (efforts to minimise pain and suffering)
